# Edox

Edox: All the important documents in one click

Problem

One of the problems of companies is that of document management.
Currently, business communications with customers, suppliers, collaborators are 99.8% made up of emails with attachments.
The remaining 0.2% is made up of letters and faxes that can easily be transformed into electronic format.

Solution

EDOX is the document management solution that allows you to store all the documentation and automatically generate the exit and entry protocol by simply forwarding the email to specific mailboxes.
The EDOX system allows what is complex with other mail systems: Sharing documents between multiple users without manual intervention on a document software.

Storing

To enter e-mails, documents and faxes in EDOX simply forward the e-mail or fax to a specific e-mail box.
The EDOX system will store and define a unique protocol number.
To separate incoming and outgoing documents, simply define two mailboxes. It is also possible to use specific customizable attributes (cost center, project, etc.) and create additional protocol boxes.

Retrieving

From the web you can retrieve both the list of documents and get the email complete with attachments, through a search in all the fields of the e-mail including the text of the email and the content of the attachments if possible.

Techniques

AI Engine
- Categorization,
- Evaluating Communications with Customers and Suppliers

Usage:
- Software as a Service,
- In-house Server
- Rugged Server

```
To try the system:
edox.online -> area riservata,
user: test password: test
