Edox

Edox: All relevant documents in a click

Problem

One of the problems of companies is that of document management.
Currently, business communications with customers, suppliers, collaborators are 99.8% made up of emails with attachments.
The remaining 0.2% is made up of letters and faxes that can easily be transformed into electronic format.
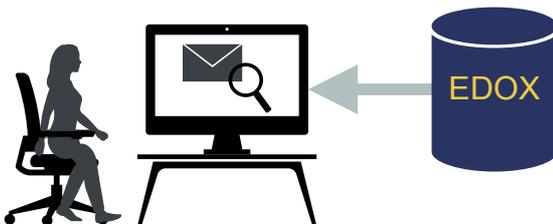

Solution

Edox is the document management solution that allows you to store all the documentation and to automatically generate the exit and entry protocol by simply forwarding the email to specific mailboxes.

The Edox system allows what is complex with other mail systems: Sharing documents between several users without manual intervention as happens in document software.

Store

To enter e-mail simply forward the e-mail to a specific e-mail box. Edox system will store and define the protocol number.
To separate incoming and outgoing documents, simply define two mailboxes. It is also possible to use specific customisable attributes (cost center, project, etc.) or create additional protocol boxes.

Search

From the web you can retrieve both the list of documents and get the email complete with attachments, through a search in all the fields of the e-mail including the text of the email and the content of the attachments if possible.
